A selective one-way bit-driving apparatus is provided between a handle 2 The selective one-way bit-driving apparatus includes a hollow 3 and a bit. 4 shaft and a bit receiver. The hollow shaft includes a first section for 5 connection with the handle and a second section. The bit receiver includes a first space for receiving the second section of the hollow shaft 6 and a second space for receiving the bit. The hollow shaft drives the bit 7 8 receiver in selective one of two directions through a selective one-way driver. At least one connector connects the wall of the first space of the 9 bit receiver with the periphery of the second section of the hollow shaft. 10
